

# Metryki RED dla aplikacji REST z Prometheus + AlertManagera

WOJCIECH BARCZYŃSKI (WOJCIECH.BARCZYNSKI@SMACC.IO)

# WOJCIECH BARCZYŃSKI

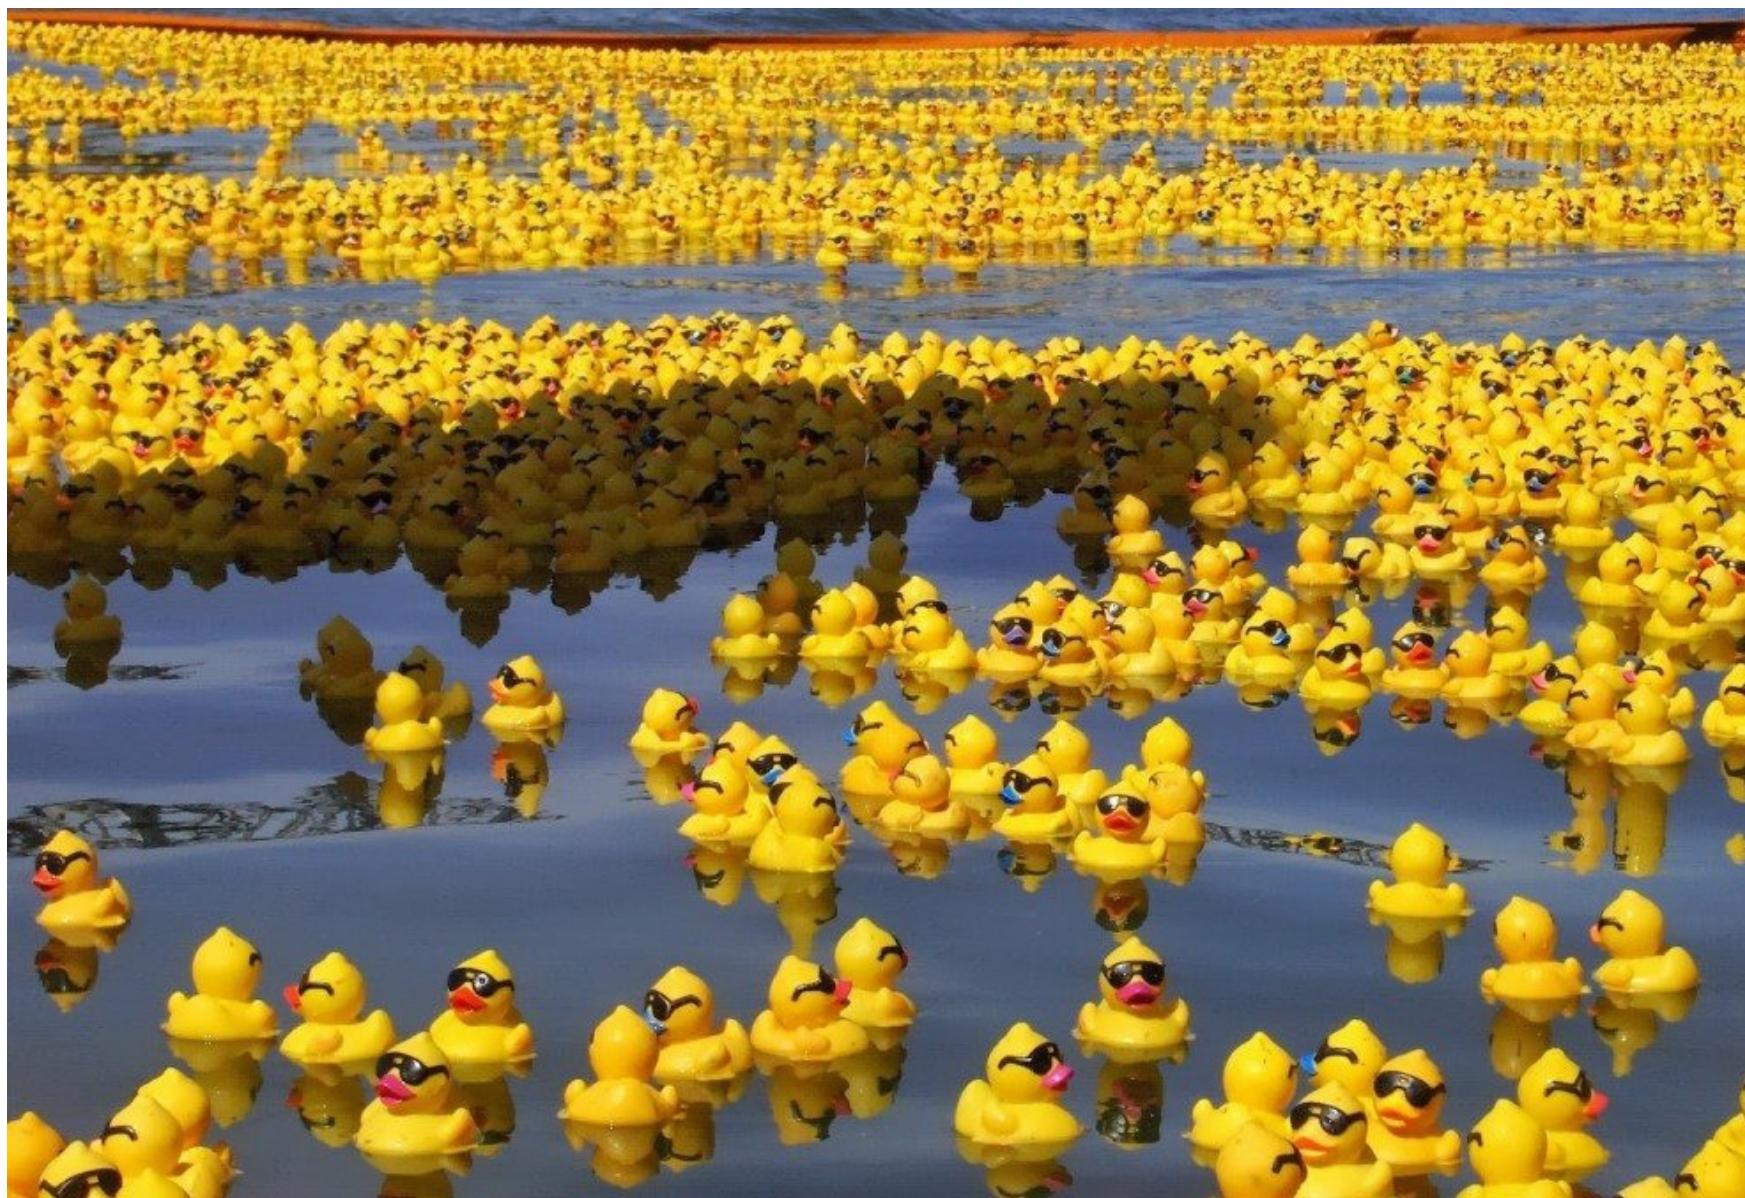

- Senior Software Engineer - SMACC (FinTech/AI)
- Before:  
System Engineer Lyke
- Before:  
1000+ nodes, 20 data centers with Openstack
- Interests:  
Working software

**WHY?  
MONOLIT ;)**

# WHY?

## MICROSERVICES ;)

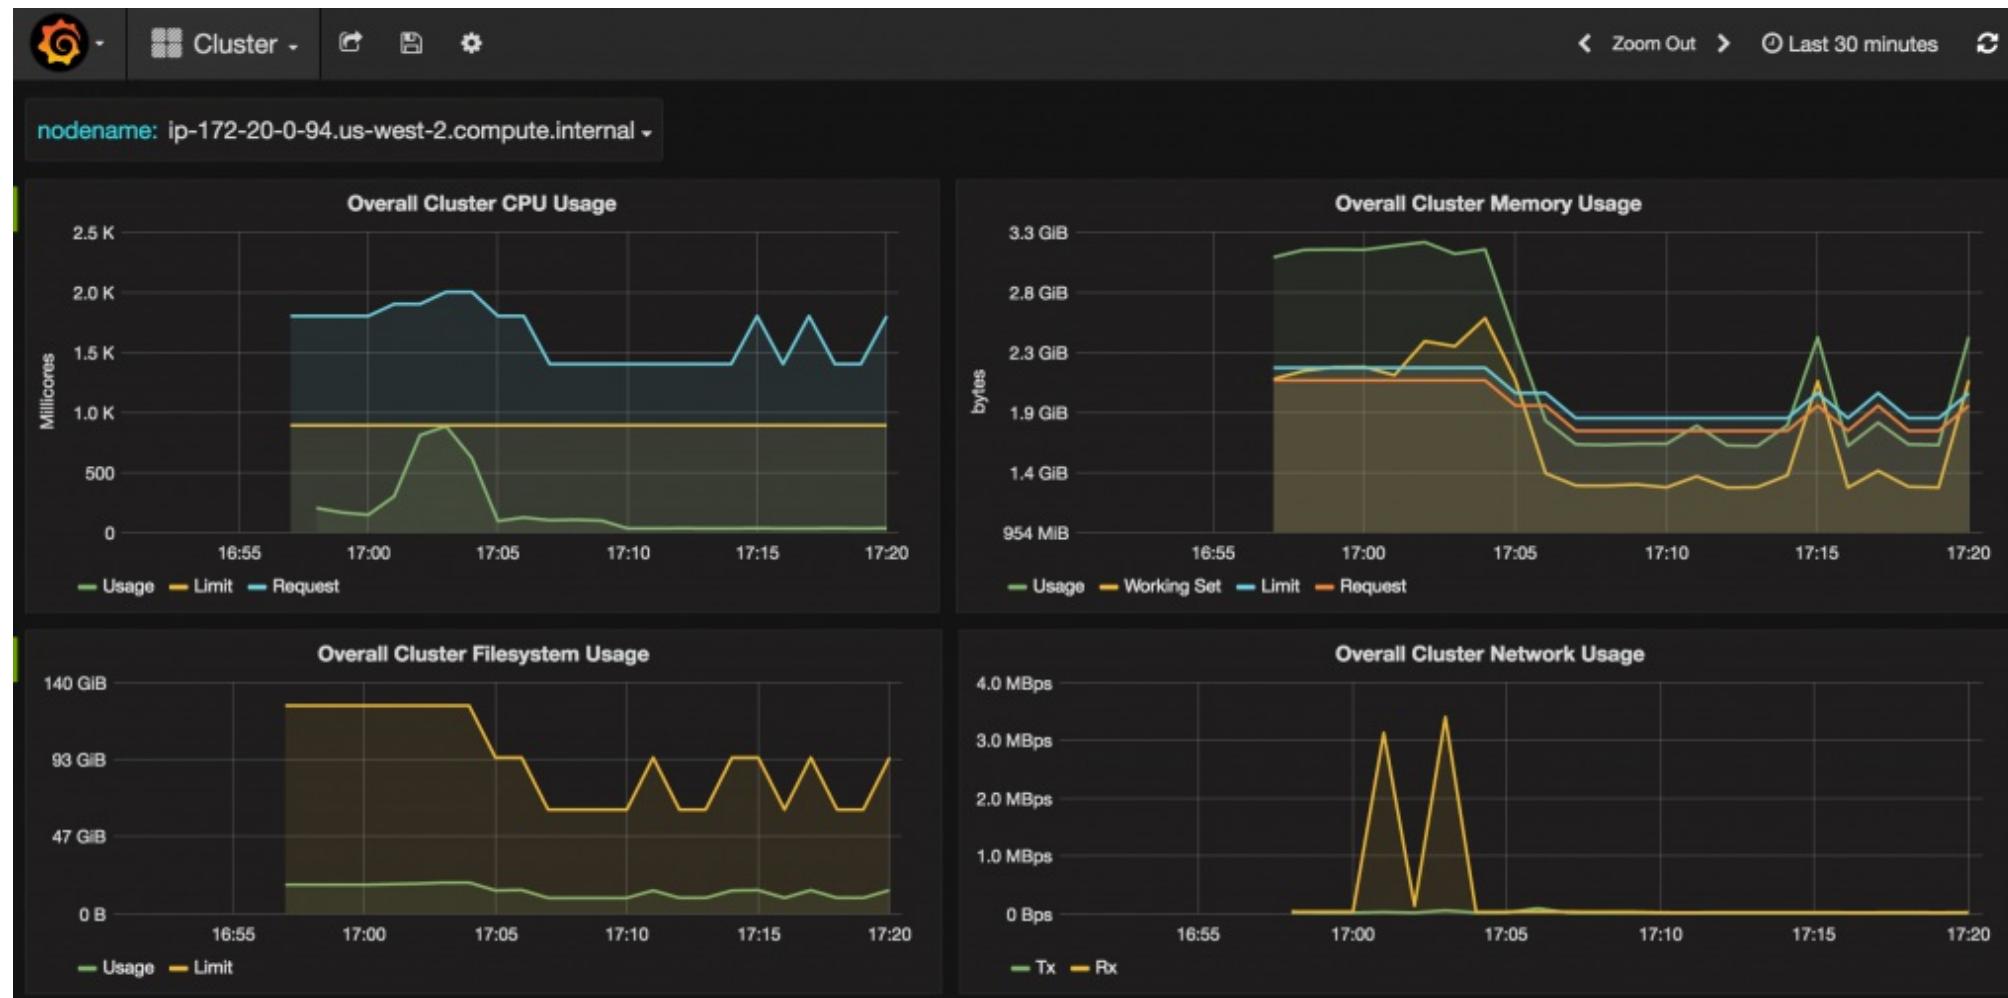

# CENTRALIZED LOGGING

- Usually much too late
- Post-mortem
- Hard to find the needle
- Like a debugging

# MONITORING

- Liczby
- Trendy
- Zależności

# MONITORING

Example from [couchbase blog](#)

# JAK ZNALEŻĆ WŁAŚCIWE METRYKI?

- USE
- RED

# USE

- utilization
- saturation
- errors

See <http://www.brendangregg.com/usemethod.html>

# USE

- **utilization:** as a percent over a time interval. eg, "one disk is running at 90% utilization".
- **saturation:**
- **errors:**

See <http://www.brendangregg.com/usemethod.html>

# USE

- **utilization:**
- **saturation:** as a queue length. eg, "the CPUs have an average run queue length of four".
- **errors:**

See <http://www.brendangregg.com/usemethod.html>

# USE

- utilization:
- saturation:
- errors: scalar counts. eg, "this network interface drops packages".

See <http://www.brendangregg.com/usemethod.html>

# USE

- traditionally more instance oriented
- still useful in the microservices world

See <http://www.brendangregg.com/usemethod.html>

# RED

- rate
- error (rate)
- duration (distribution)

Service oriented

# **RED**

- **rate** - how many requests per seconds handled
- **error**
- **duration (distribution)**

# RED

- rate
- error - how many request per seconds handled we failed
- duration

# **RED**

- **rate**
- **error**
- **duration** - how long the requests took

# RED

- Follow Four Golden Signals by Google SREs [1]
- Focus on what matters for end-users

[1] Latency, Traffic, Errors, Saturation ([src](#))

# NOTICE

- not recommended for batch-oriented or streaming services

# MY WEAPONS OF CHOICE

- Prometheus
- Alertmanager
- Grafana
- Not covered here: OpsGenie, StatusCake

# PROMETHEUS

- wide support for languages
- metrics collected over HTTP *metrics/*
- metrics in text

# PROMETHEUS

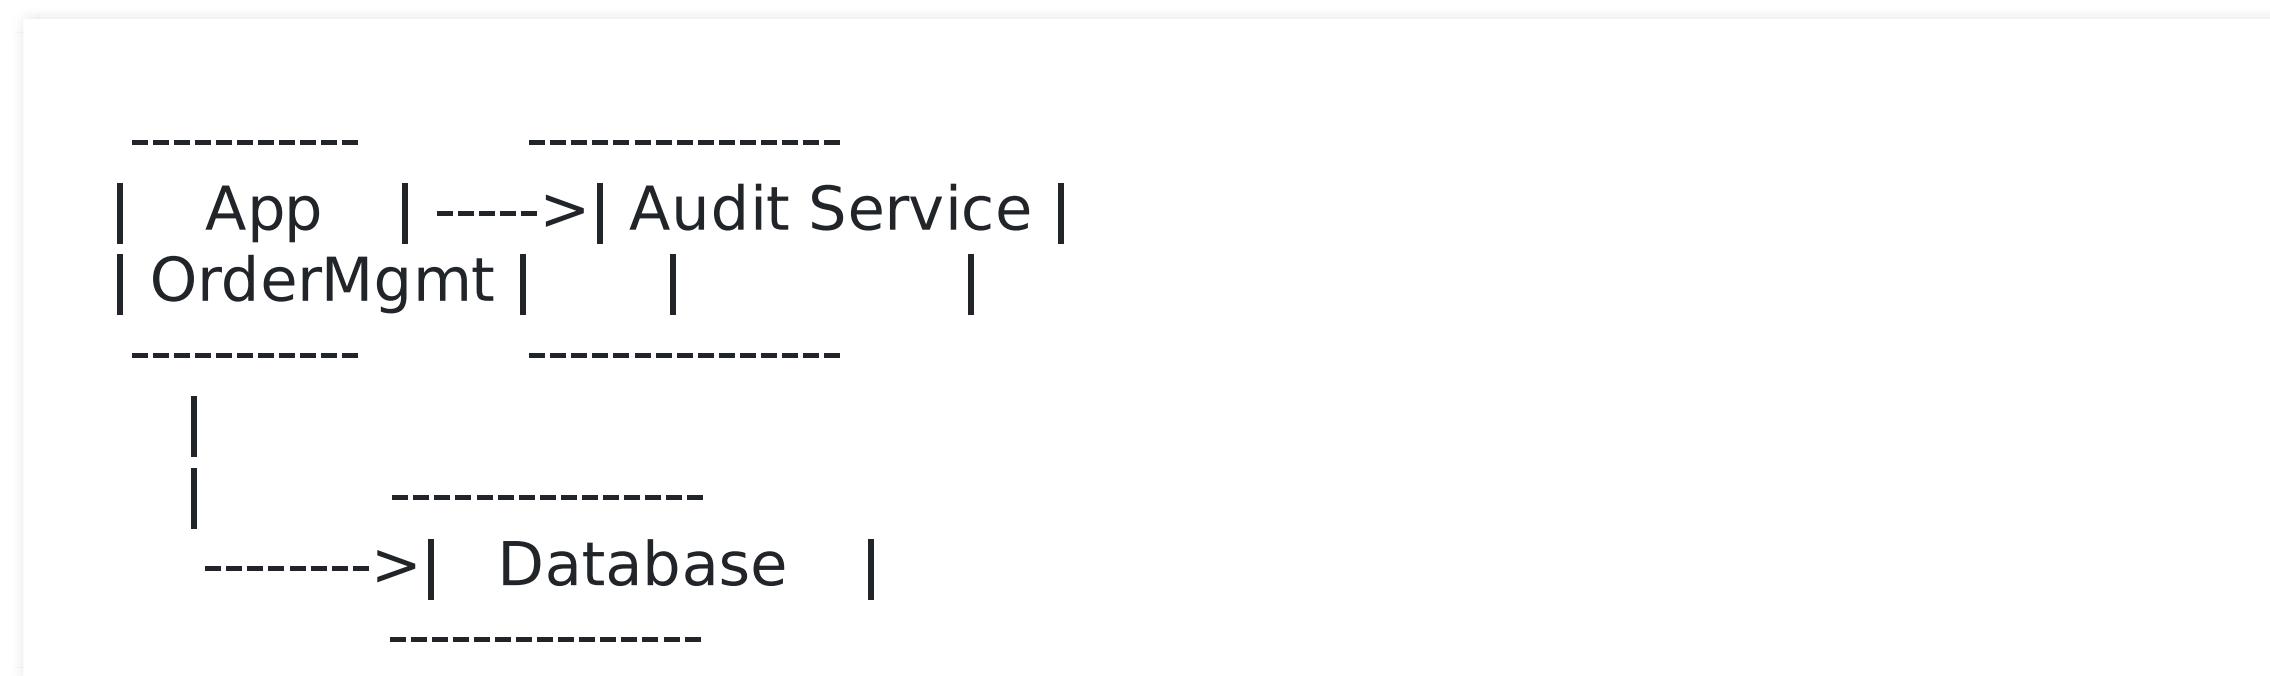

- Easy semantic
- Large number of prometheus exporters
- Focus on low TCO and simplicity
- Powerful query and alarm rule language
- Pull model [1]

[1] I prefer it

# METRIC TYPES

- Counter - just up
- Gauge - up/down
- Histogram - samples observation (*sum + count with buckets*)
- Summary - (*sum + count*)

# SIMPLE REST SERVICE

# SIMPLE REST SERVICE

```
curl 127.0.0.1:8080/hello  
curl 127.0.0.1:8080/world  
curl 127.0.0.1:8080/complex
```

# SIMPLE REST SERVICE

```
curl 127.0.0.1:8080/complex?is_srv_error=True  
curl 127.0.0.1:8080/complex?is_db_error=True  
curl 127.0.0.1:8080/complex?db_sleep=3&srv_sleep=2
```

# OPERATION ENDPOINTS

metrics/

Omitied:

- *health/*
- *info/*
- *alertrules/*

# PYTHON CLIENT

- [https://github.com/prometheus/client\\_python](https://github.com/prometheus/client_python)

## DEMO: CODE

- Metric definition
- Metric collection
- Exposing metrics `metrics/`

# DEMO: PROM STACK

- Prometheus dashboard and config
- AlertManager dashboard and config
- Simulate the successful and failed calls
- Simple Queries for rate

# PROMETHEUS

```
sum(irate(order_mgmt_duration_seconds_count{job=~".*"}[1m]))  
by (status_code)
```

# PROMETHEUS

# METRIC NAMES

Which one is better?

- request\_duration{app=my\_app}
- my\_app\_request\_duration

# METRIC NAMES

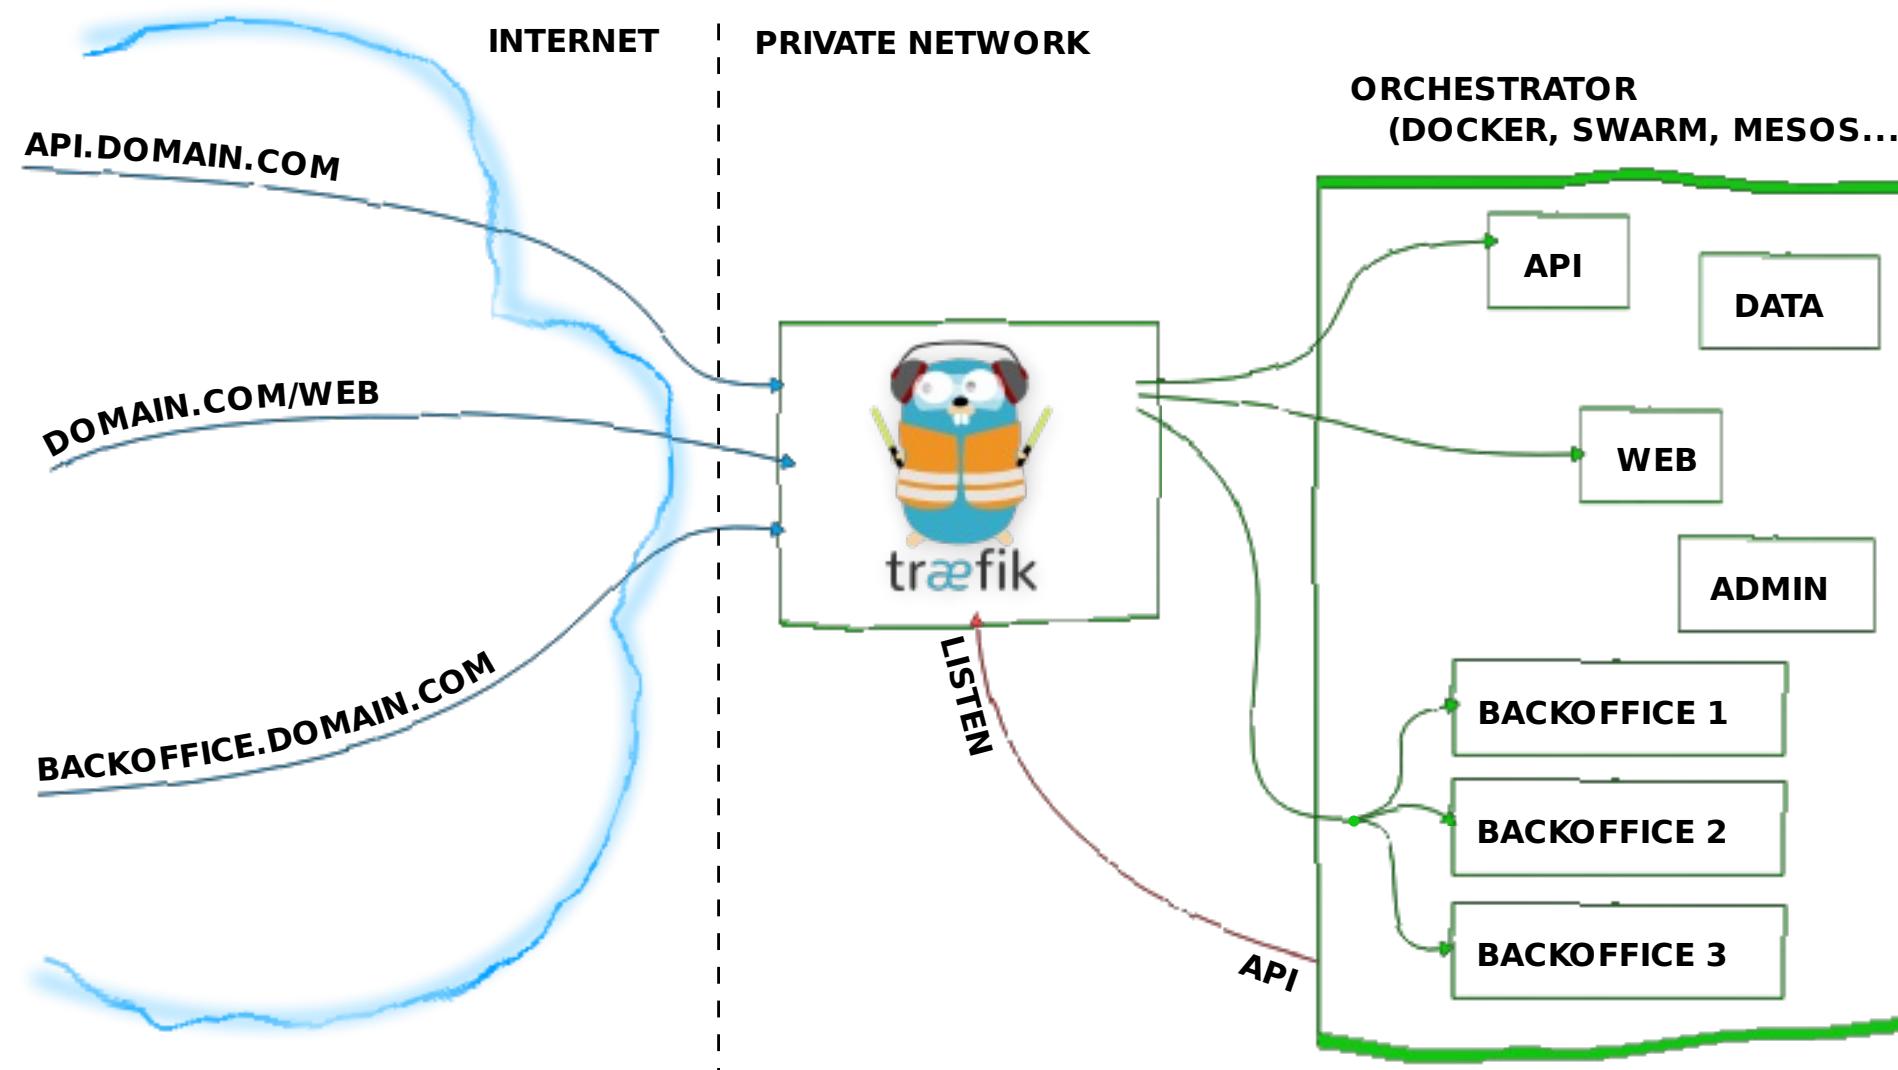

Which one is better?

- `order_mgmt_db_duration_seconds_sum`
- `order_mgmt_duration_seconds_sum{dep_name='db'}`

# PROMETHEUS EXPORTERS

- Mongodb
- Postresql
- ...

# MONITORING INGRESS

- --web.metrics.prometheus

## NEXT STEPS

- Extend the sample application with OpenZipkin
- In daily work, evaluating new: linkerd.io, istio.io, ...

# SUMMARY

- Monitoring saves your time
- Checking logs **Kibana** to check whether your component works is like debugging vs having tests
- Logging -> high TCO

# BACKUP SLIDES

```
123 def distance_matrix(regions):
124     """ Computes a distance matrix against a region list """
125     tuples = [r.as_tuple() for r in regions]
126     return cdist(tuples, tuples, region_distance)
127
128
129 def clusterize(words, **kwargs):
130     # TODO: write a cool docstring here
131     db = DBSCAN(metric="precomputed", **kwargs)
132     X = distance_matrix([Region.from_word(w) for w in words])
133     labels = [int(l) for l in db.fit_predict(X)]
```

# USE LABELS IN ALERT RULES

```
ALERT ProductionAppServiceInstanceDown
  IF up { environment = "production", app =~ ".+" } == 0
  FOR 4m
  ANNOTATIONS {
    summary = "Instance of {{$labels.app}} is down",
    description = " Instance {{$labels.instance}} of app {{$labels.app}}
  }
```

see .../src/prometheus/etc/alert.rules

# USE LABELS IN ALERT ROUTING

Call somebody if the label is `severity=page`:

```
---
```

```
group_by: [cluster]
# If an alert isn't caught by a route, send it to the pager.
receiver: team-pager
routes:
- match:
  severity: page
  receiver: team-pager

receivers:
- name: team-pager
  opsgenie_configs:
  - api_key: $API_KEY
    teams: example_team
```

see `../src/alertmanager/*.conf`

# THANK YOU

```
